

## More Details on the Content Management and Exchange Website

I need to build a website that is similar to a Wiki / Content Management System and has the following functions:

### Major Features:

1. Registered users can create entries according to preset format (including a terminology and its definition)

When the users contribute to wiki, they have to go through two steps. The first is to fill out a webform that has a couple of check boxes and a few small text fields.

Assume that we are creating a wiki for resume for different types of jobs. Every resume has to follow a structure: education background, work experience, award, certificates, etc. So I would like all contributors to fill in each part of the preset "resume form", not just posting the whole resume as text or attachment.

2. The contributed entries will be stored in a database

3. Other registered users of the website can browse entries in the database, or search for the entries using key words;

When other users login, they can search for everything submitted by the webform and the large text field.

For example, they can just search for "part-time work experience for student". The search results will include only the "part-time work" sections of stored resumes.

4. After getting the search results, the user can select and save their favourite entries under his/her account.

5. The user can generate a summary report with all the selected entries. The user can generate a formatted report in a pdf format or export it as a text file.

Say the user gets 10 matching results. The user then select only the best of them, revise it to reflect his own experience (e.g. change the name of the firm and the salary), and insert the revised text into the "part-time work experience" section of his own resume template. After he fills in all the necessary fields of his resume template, he can then generate a PDF format resume, save it, print it, or sent it to someone through e-mail.

6. Each user will also be ranked on the usefulness and uniqueness of entries contributed and the number of times the entries are selected by other users.

7. I would also like to have advertisement links to the website (such as google ad sense), and an online payment processing system to allow the contributor to charge fees and the user to pay fees.

**Other requirements:**

This is a brand-new site. I need full design done, with graphics, including a new logo.

In terms of style, I want a very professional look with bright colors that will appeal to my clients who are typically young professionals. It also needs to be very simple and easy to use.

Specific expertise that I am seeking:

Experience on website design, programing, and database is essential. Experience with promoting website through search engines is a plus.

**Timeframe for delivery:**

I need to have this up and running within 45 days.
