

Create software package to play Audio/Video previews

1. Software need to be designed for Windows XP and Windows Vista
2. Software is for commercial use and should be protected with registration validation.
3. Different tabs in program (like morpheus or other p2p programs)
 - Class 1:Audio/Video Lists
 - A/V Play list: list with media that will be sequentially/randomly played
 - A/V Full list: list with all media files that can be activated by barcode scanner.
 - A/V download list: list with add function to include url's to be downloaded.
 - A/A Error list: unsuccessful downloads
 - Class 2: Sponsor lists
 - Sponsor Play list: list with sponsor media files that will be sequentially/randomly played
 - Sponsor download list: list with add function to include url's to be downloaded.
4. Possibility to move files in each class between the different media lists.
5. Media files will be stocked in separated directories on a selectable hard disk.
6. Supported media files:

All type of media (audio/video) files should be supported.
Most imported is to play Quicktime HD movies.

 - a. Quicktime (most imported in HD quality)
 - b. windows media player
 - c. flash
 - d. All audio types
7. Media should start playing as soon as barcode is read by scanner
If a file is playing, it should be stopped and replaced by the file corresponding to the new barcode entry.
8. Programmable on/off barcode:
the computer should turn into sleep mode when the ON/OFF barcode is scanned.
Scanning a second time the ON/OFF barcode should start up the computer again and run this software.
User will be able to select the ON and OFF barcodes by scanning them (example: package of cigarettes to start and stop all activity)

See an example of this application at:
