

Project PAD

Proposal

Concept

- You've all seen these videos that show someone's face changing over the years – taken from hundreds or thousands of still shots. “Timelapse videos”.
- We need an application that can facilitate the piecing together of these images.
- Upload your image, possibly add a comment, and then view it either as an album or as a timelapse video.
- Should have a core membership system.

How?

- We imagine the user uploading a photo.
- This photo is added in order to a series.
- The order of the photos in this 'series' can be changed by dragging the pictures.
- Each picture has a caption and notes can be added.
- There is the option to play this series, and export into swf/avi. Watermarked.
- The time that each picture is shown for is editable.

Users

- Users have their own accounts; and control whether pictures from their feeds are put onto the homepage.
- They can set a reminder to be emailed to them every day, every other day, etc.
- Comments can be viewable by others or private. Should be able to set each comment's privacy separately.

Administration

- ****Administration should be based on the main user account system rather than a separate user system****
- Admins can view all of a users pictures in an overview, And can suspend a user account easily. Can also delete user accounts and delete individual images, like the users can themselves.

Additional

- User can use their WEBCAM or attached camera to take an image.
- Possibly a version where users record a short video for each day.
- Users can post content to social networking sites (share). An easy addition.
- Will be more to come; as consultation continues with the winning bidder.
