

Dynamic Category Tree Extension for Auctionbutler.net

At the moment in Auctionbutler.net the display of categories is not very well solved. There is some navigation possible but the status is, that the choices of categories are very limited. This was nice to start with, but for an professional search functionality it is not well enough.

This Category Tree has to be modified with Ajax. While clicking on an Category the next lower category level (all entries) will be displayed with the number of entries. Always 1 level above the last clicked category will be displayed also. In the bottom line exist an field to collapse the whole tree or to open it completely. It is important to make sure that the field in which the categories are being displayed will grow with the content just by setting the next field deeper or higher.

Of course the clicking on the categories will have also implications for the displayed search results similar as it does already now.

Proceeding

Against an NDA you will get an backup of the actual page and have to develop the solution on your own server, only after I have tested it on your server you may install the solution on mine. I work with GAF Escrow system only. Bids proposing any other proceeding will not be considered.
